Setting up

4 of 4 done

- ☒ Unfold the table
- ☒ Lay out the crates
- ☒ Put up the price board
- ☒ Switch on the card reader

All set: the stall is open.

Today's tip

Honey sells best before noon: put the jars at the front.

How this document works

Every reaction here is a handler: an action in the cell's **on** that runs when an event reaches it. The document counts **open** in `visits`. The rate is a **fetch** cell that the server refreshes every 30 seconds; its **load** handler sets `warn`, which shows the warning. Clicking the rate fetches it again. The produce table handles **click** (look) and **dblclick** (add), calling the custom action `(add item qty)`, which the two buttons call with other arguments. **Place the order** saves a record and sends the custom event `order-placed` with the total; the order counter and the thank-you note both listen. Ticking the last set-up item saves a record and shows the ready note. Two **timers** turn the offer and show the tip. Switch to Edit and open a cell's Events to see and change each one.
